Following the peer review of my initial project pitch, I have implemented three key iterative changes to the final prototype and video script to deepen the research rigor:

- **Historical Grounding:** In response to feedback regarding the 'history of photography,' I integrated research into the 1950s **Shirley Card** the original 'Eurocentric' skin-tone calibration tool. This provides a direct historical ancestor to the modern 'Coded Inequity' (Benjamin, 2019) found in today's beauty filters.
- **Hardware vs. Software:** One reviewer noted that camera settings themselves are built for lighter skin. I have updated the **Task 09 Technical Prototype** to include 'Automated Skin Lightening' as a specific technical intervention zone, moving the project from a purely aesthetic critique to a technical one.
- **Relatability & Scope:** To make the concept more 'relatable' to a wider audience as suggested, I expanded the visual examples to include **Apple's 'Correction Filters'**. This demonstrates that these algorithmic biases are not just found on social media, but are embedded in the default 'gaze' of our everyday devices.
